

DevOps Study Night

DEVOPS COMMAND LINE

Who are these people?

Tricia Radcliffe is DevOps Lead for Women Who Code Portland. She is a Sales Engineer at AppDynamics. She comes from a sysadmin/operations background, with experience as a developer. In her free time, Tricia is also a budding farmer, she's raising an army of hens and knows how to run a tight coop!

Cynthia Kwok is Co-lead for DevOps and Algorithms study nights for Women Who Code Portland. She has a BS in Computer Science from University of California, Riverside. Cynthia has recently moved to Portland, and is currently dabbling with automation and DevOps in her spare time.

How do I get to the Command Line?

- If you are on a mac, you can open 'terminal' or download 'iterm'
 - <https://www.iterm2.com/>
- On Windows you can open a command line or powershell to access the command line.
- Many code editors have interactive terminals

Windows User

Our talk today will be using linux commands so we will provide a linux shell.
In order to access it, please download and install PUTTY

<http://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html>

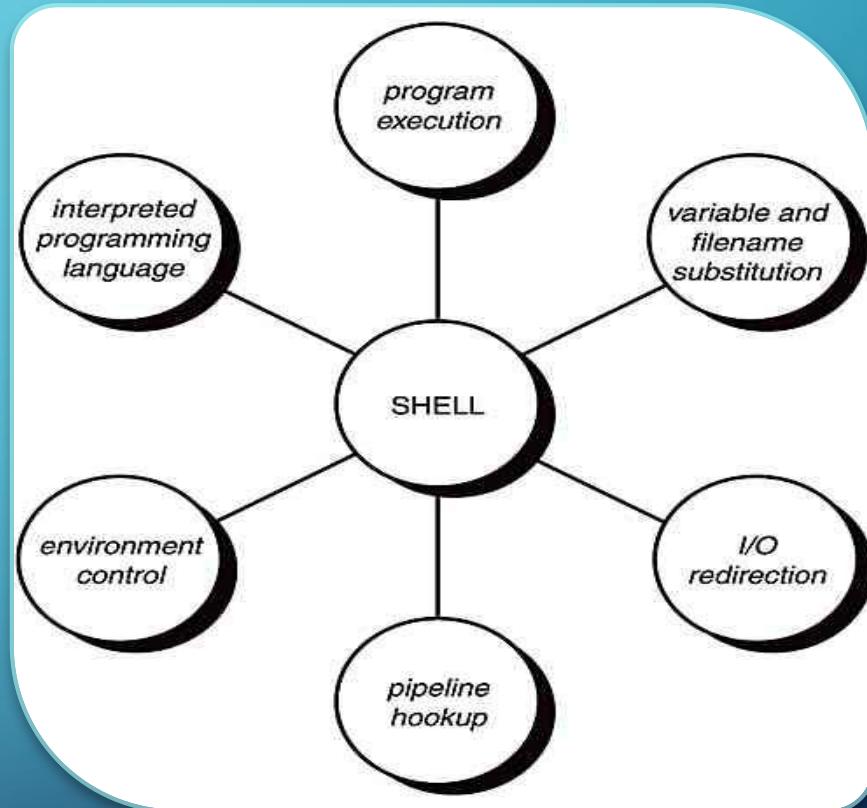

Once installed, create a ssh session

host: 64.94.138.242

user: staffN password: abc123

What is a shell?

A **Unix shell** is a command-line interpreter or **shell** that provides a traditional **Unix**-like command line user interface. Users direct the operation of the computer by entering commands as text for a command line interpreter to execute, or by creating text scripts of one or more such commands.

There are MANY shells

sh

- The Bourne shell, called "sh," is one of the original shells, developed for Unix computers by Stephen Bourne at AT&T's Bell Labs in 1977. Its long history of use means many software developers are familiar with it. It offers features such as input and output redirection, shell scripting with string and integer variables, and condition testing and looping.

bash

- The popularity of sh motivated programmers to develop a shell that was compatible with it, but with several enhancements. Linux systems still offer the sh shell, but "bash" -- the "Bourne-again Shell," based on sh -- has become the new default standard. One attractive feature of bash is its ability to run sh shell scripts unchanged. Shell scripts are complex sets of commands that automate programming and maintenance chores; being able to reuse these scripts saves programmers time. Conveniences not present with the original Bourne shell include command completion and a command history.

csh and tcsh

- Developers have written large parts of the Linux operating system in the C and C++ languages. Using C syntax as a model, Bill Joy at Berkeley University developed the "C-shell," csh, in 1978. Ken Greer, working at Carnegie-Mellon University, took csh concepts a step forward with a new shell, tcsh, which Linux systems now offer. Tcsh fixed problems in csh and added command completion, in which the shell makes educated "guesses" as you type, based on your system's directory structure and files. Tcsh does not run bash scripts, as the two have substantial differences.

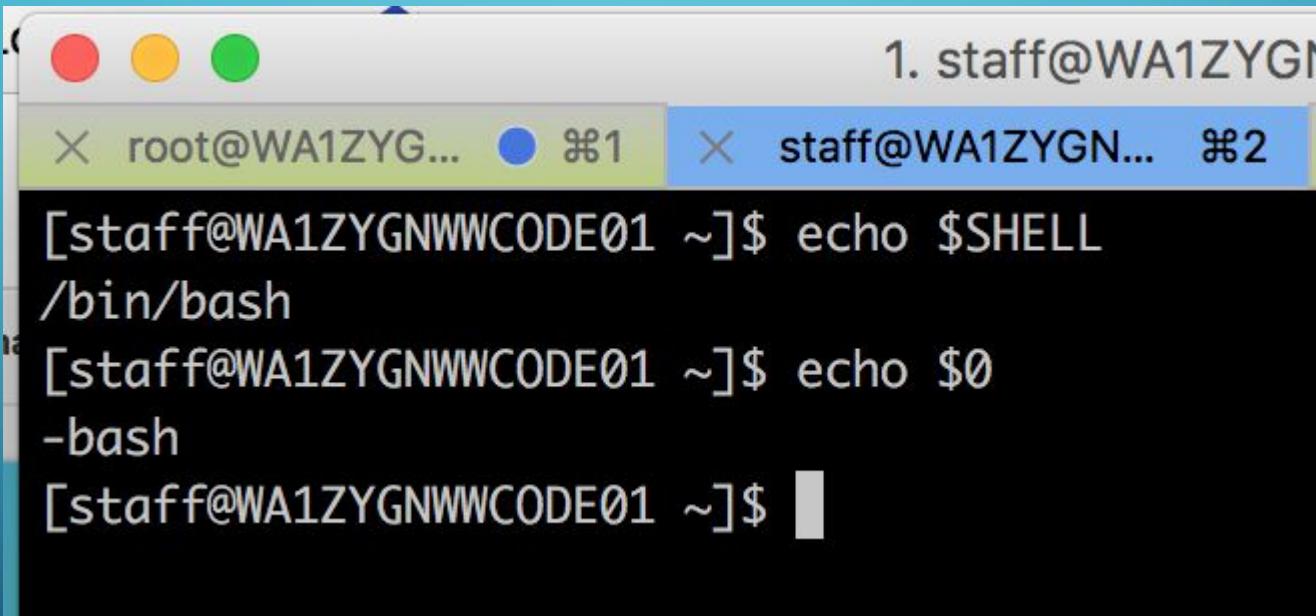

ksh

- David Korn developed the Korn shell, or ksh, about the time tcsh was introduced. Ksh is compatible with sh and bash. Ksh improves on the Bourne shell by adding floating-point arithmetic, job control, command aliasing and command completion. AT&T held proprietary rights to ksh until 2000, when it became open source.

HANDS ON: What shell am I in?

```
$ echo $0
```

```
$ echo $shell
```

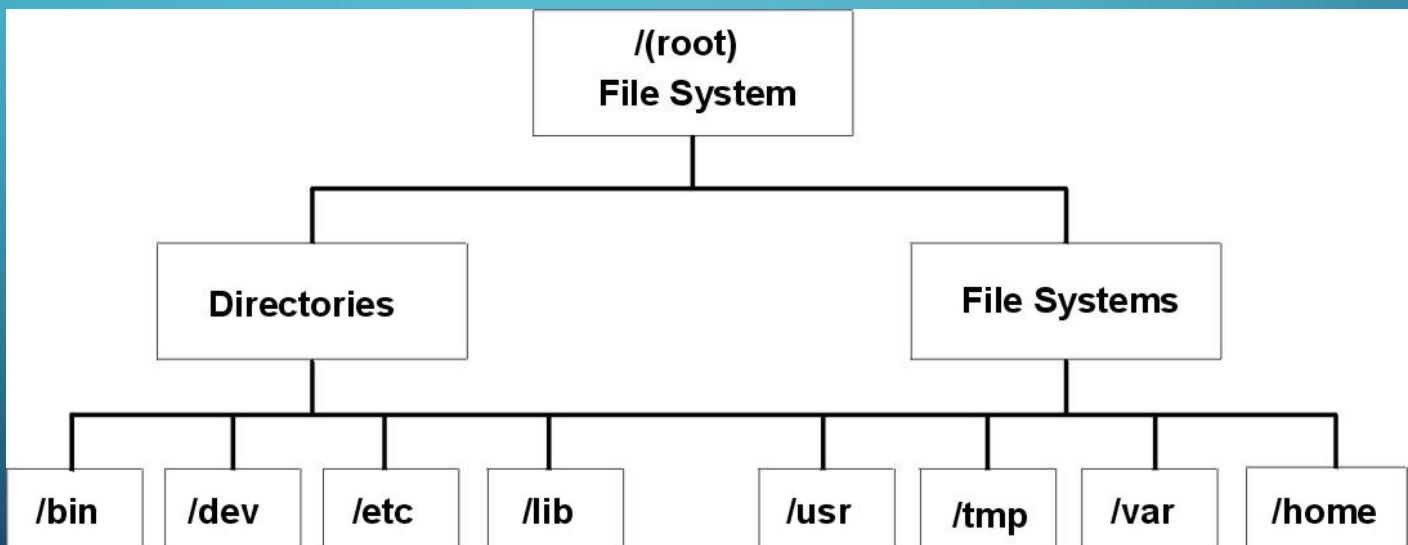

```
1. staff@WA1ZYGN...  
X root@WA1ZYG... ●⌘1 X staff@WA1ZYGN... ⌘2  
[staff@WA1ZYGNWWCODE01 ~]$ echo $SHELL  
/bin/bash  
[staff@WA1ZYGNWWCODE01 ~]$ echo $0  
-bash  
[staff@WA1ZYGNWWCODE01 ~]$ █
```

File System Standards

Is the method or structure by which files are stored on Disk, which varies per distribution

Important:

- Knowing how to navigate the structure
- Knowing what each folder's designation/purpose

Symbolic Links

The **ln** command is a standard **Unix** command utility used to create a hard link or a symbolic link (symlink) to an existing file. The use of a hard link allows multiple filenames to be associated with the same file since a hard link points to the inode of a given file, the data of which is stored on disk.

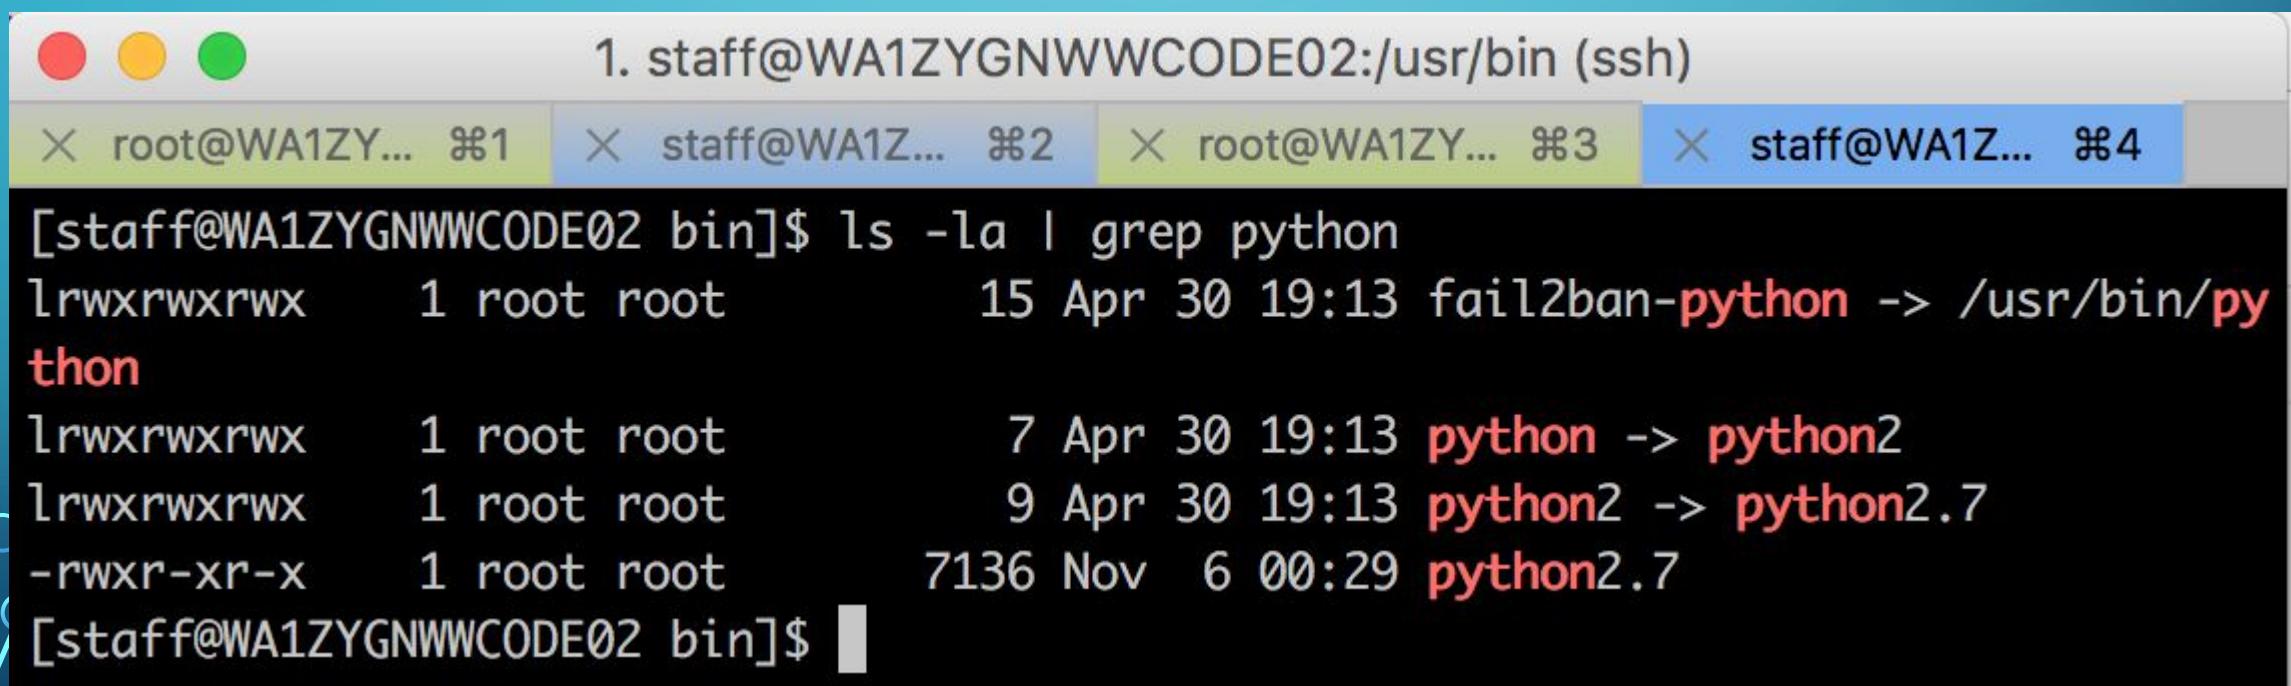

Most often you will run into symbolic links

\$ **ln -s <originlocation\file> <linklocation\file>**

```
node_modules/.bin/apm          1. more
lrwxr-xr-x  1 tricia.radcliffe admin

```

HANDS ON: Looking at directories & linked files

```
$ ls -la /usr/bin | grep python
```

The screenshot shows a terminal window with four tabs open. The active tab is titled "root@WA1ZYGNWWCODE02:/usr/bin (ssh)". The command entered is "ls -la | grep python". The output lists several symbolic links:

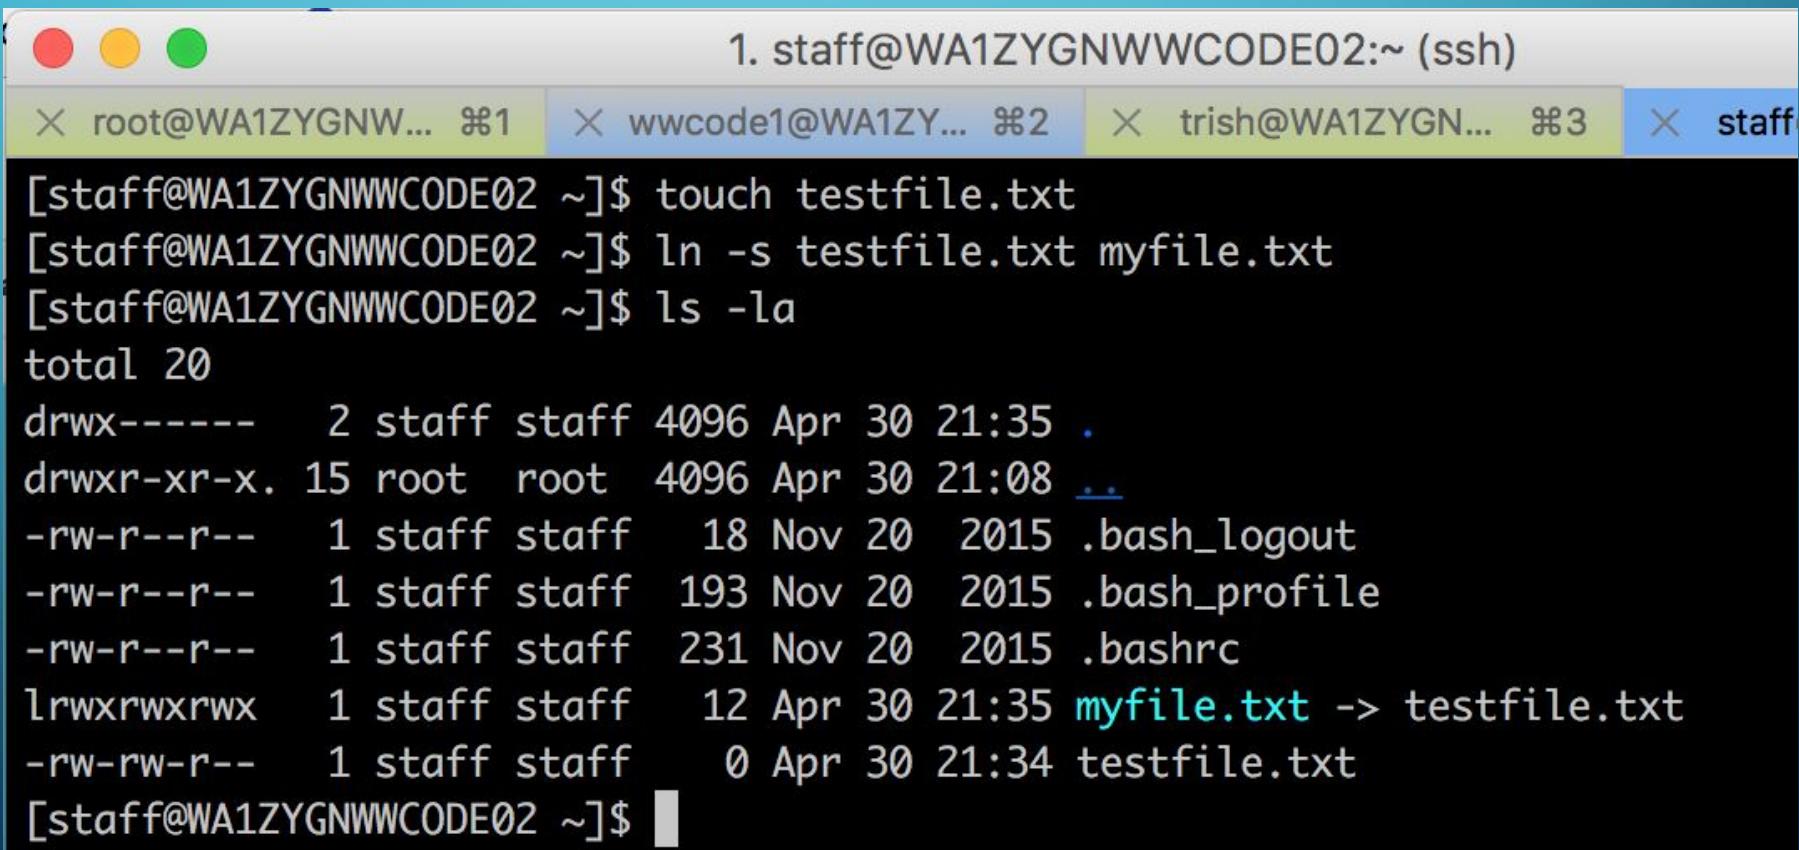

| File | Type | Owner | Last Modified | Target |
|-----------------|------|-------|------------------|------------------------------------|
| fail2ban-python | l | root | 15 Apr 30 19:13 | fail2ban-python -> /usr/bin/python |
| python | l | root | 7 Apr 30 19:13 | python -> python2 |
| python2 | l | root | 9 Apr 30 19:13 | python2 -> python2.7 |
| python2.7 | - | root | 7136 Nov 6 00:29 | python2.7 |

HANDS ON: Create a link

```
$ touch testfile.txt
```

```
$ ln -s testfile.txt myfile.txt
```

```
$ ls -la
```

The screenshot shows a terminal window with four tabs at the top: root@WA1ZYG... #1 (highlighted), wwcode1@WA1ZY... #2, trish@WA1ZGN... #3, and staff. The terminal window displays the following command sequence:

```
[staff@WA1ZYGNNWCODE02 ~]$ touch testfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ ln -s testfile.txt myfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ ls -la
total 20
drwx----- 2 staff staff 4096 Apr 30 21:35 .
drwxr-xr-x. 15 root root 4096 Apr 30 21:08 ..
-rw-r--r-- 1 staff staff 18 Nov 20 2015 .bash_logout
-rw-r--r-- 1 staff staff 193 Nov 20 2015 .bash_profile
-rw-r--r-- 1 staff staff 231 Nov 20 2015 .bashrc
lrwxrwxrwx 1 staff staff 12 Apr 30 21:35 myfile.txt -> testfile.txt
-rw-rw-r-- 1 staff staff 0 Apr 30 21:34 testfile.txt
[staff@WA1ZYGNNWCODE02 ~]$
```

What's going on?

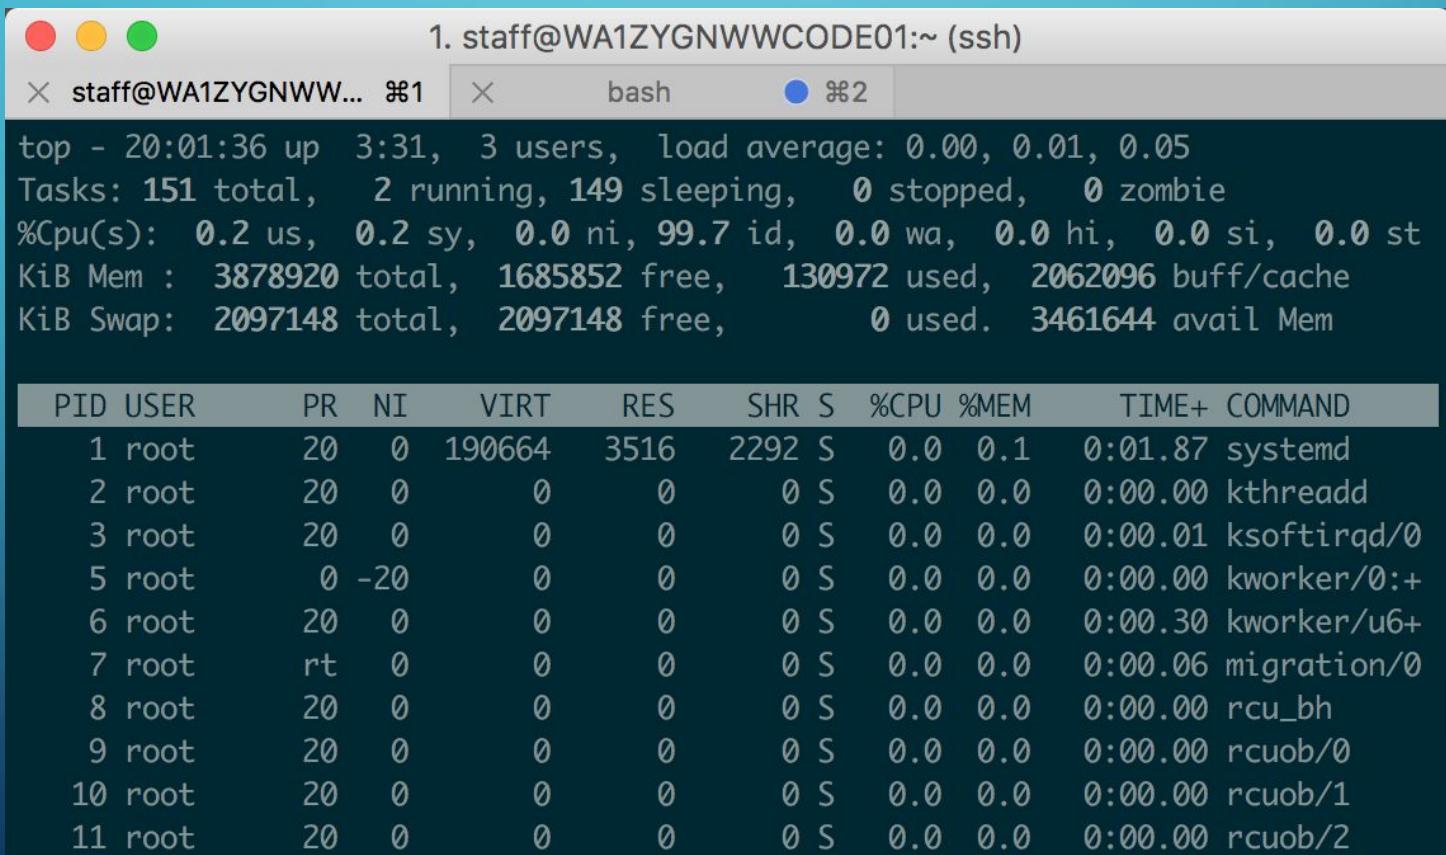

Knowing how to look up:

- what processes are running
- how much memory is being used (RAM and Disk)
- what's the ip address?
- how to kill a process

CPU: top or ps

\$ **top**

displays updated sorted info on processes

The screenshot shows a terminal window titled "1. staff@WA1ZYGNWWCODE01:~ (ssh)". The window contains the following text:

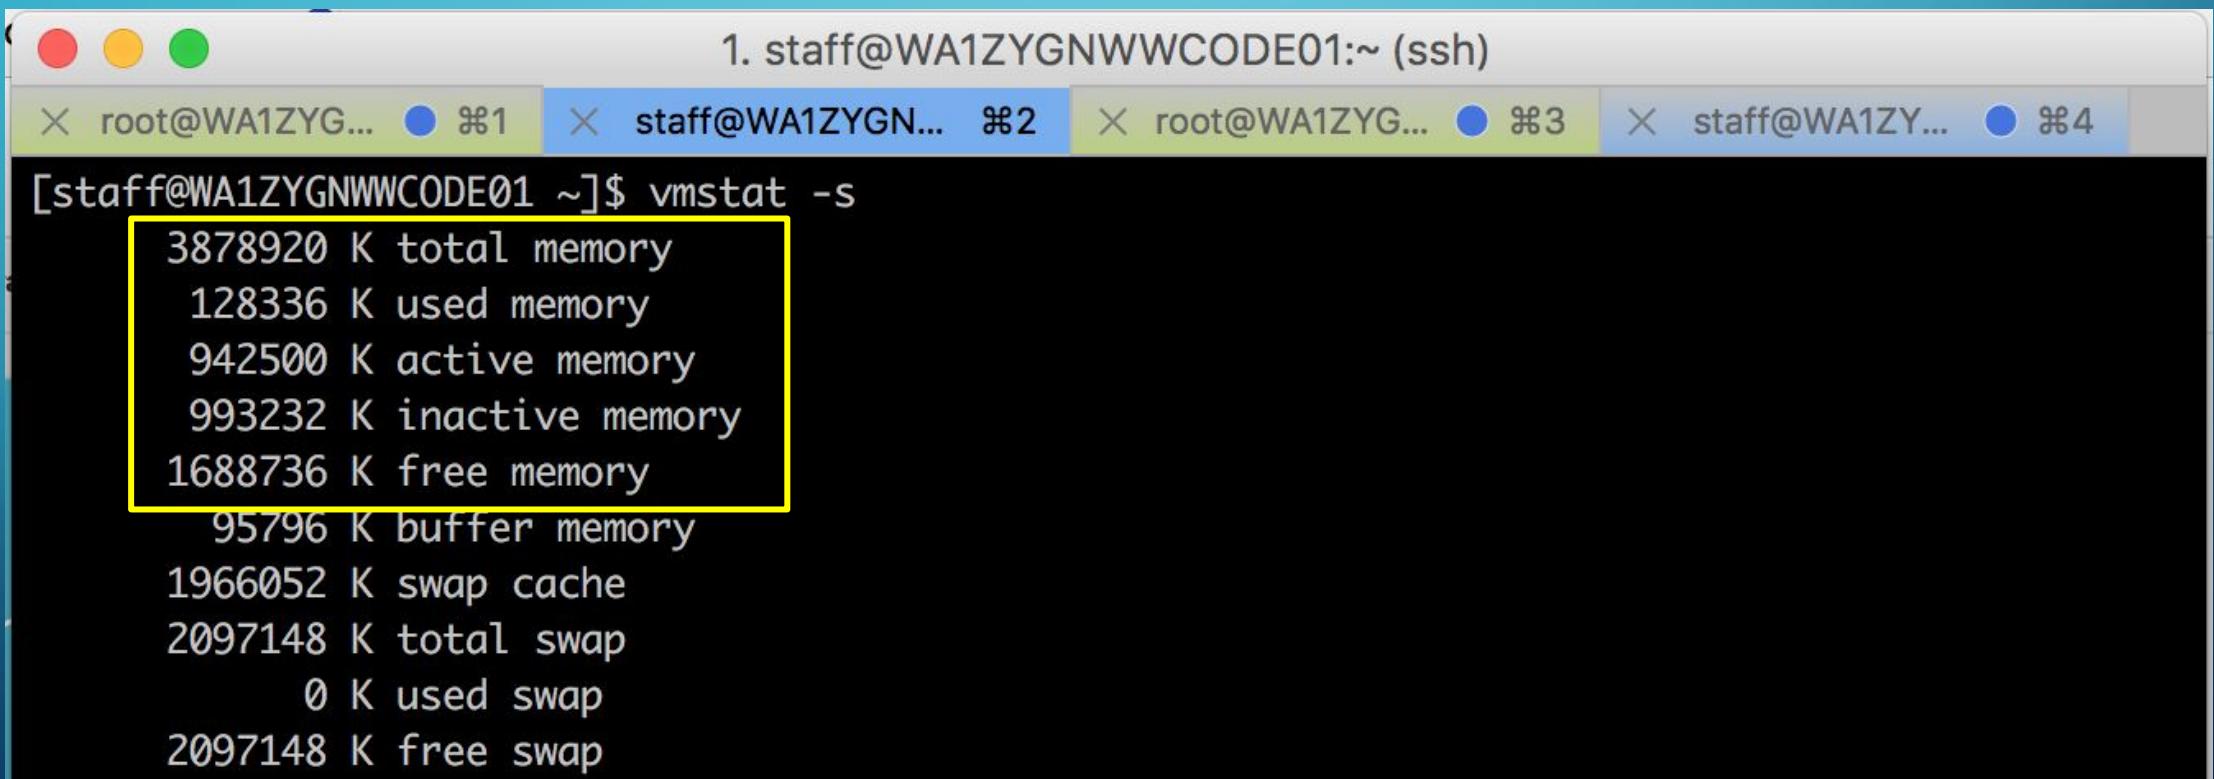

```
top - 20:01:36 up 3:31, 3 users, load average: 0.00, 0.01, 0.05
Tasks: 151 total, 2 running, 149 sleeping, 0 stopped, 0 zombie
%Cpu(s): 0.2 us, 0.2 sy, 0.0 ni, 99.7 id, 0.0 wa, 0.0 hi, 0.0 si, 0.0 st
KiB Mem : 3878920 total, 1685852 free, 130972 used, 2062096 buff/cache
KiB Swap: 2097148 total, 2097148 free, 0 used. 3461644 avail Mem
```

Below this, a table displays process information:

| PID | USER | PR | NI | VIRT | RES | SHR | S | %CPU | %MEM | TIME+ | COMMAND |
|-----|------|----|-----|--------|------|------|---|------|------|---------|-------------|
| 1 | root | 20 | 0 | 190664 | 3516 | 2292 | S | 0.0 | 0.1 | 0:01.87 | systemd |
| 2 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.00 | kthreadd |
| 3 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.01 | ksoftirqd/0 |
| 5 | root | 0 | -20 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.00 | kworker/0:+ |
| 6 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.30 | kworker/u6+ |
| 7 | root | rt | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.06 | migration/0 |
| 8 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.00 | rcu_bh |

| 10 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.00 | rcuob/1 |
| 11 | root | 20 | 0 | 0 | 0 | 0 | S | 0.0 | 0.0 | 0:00.00 | rcuob/2 |

Memory: vmstat

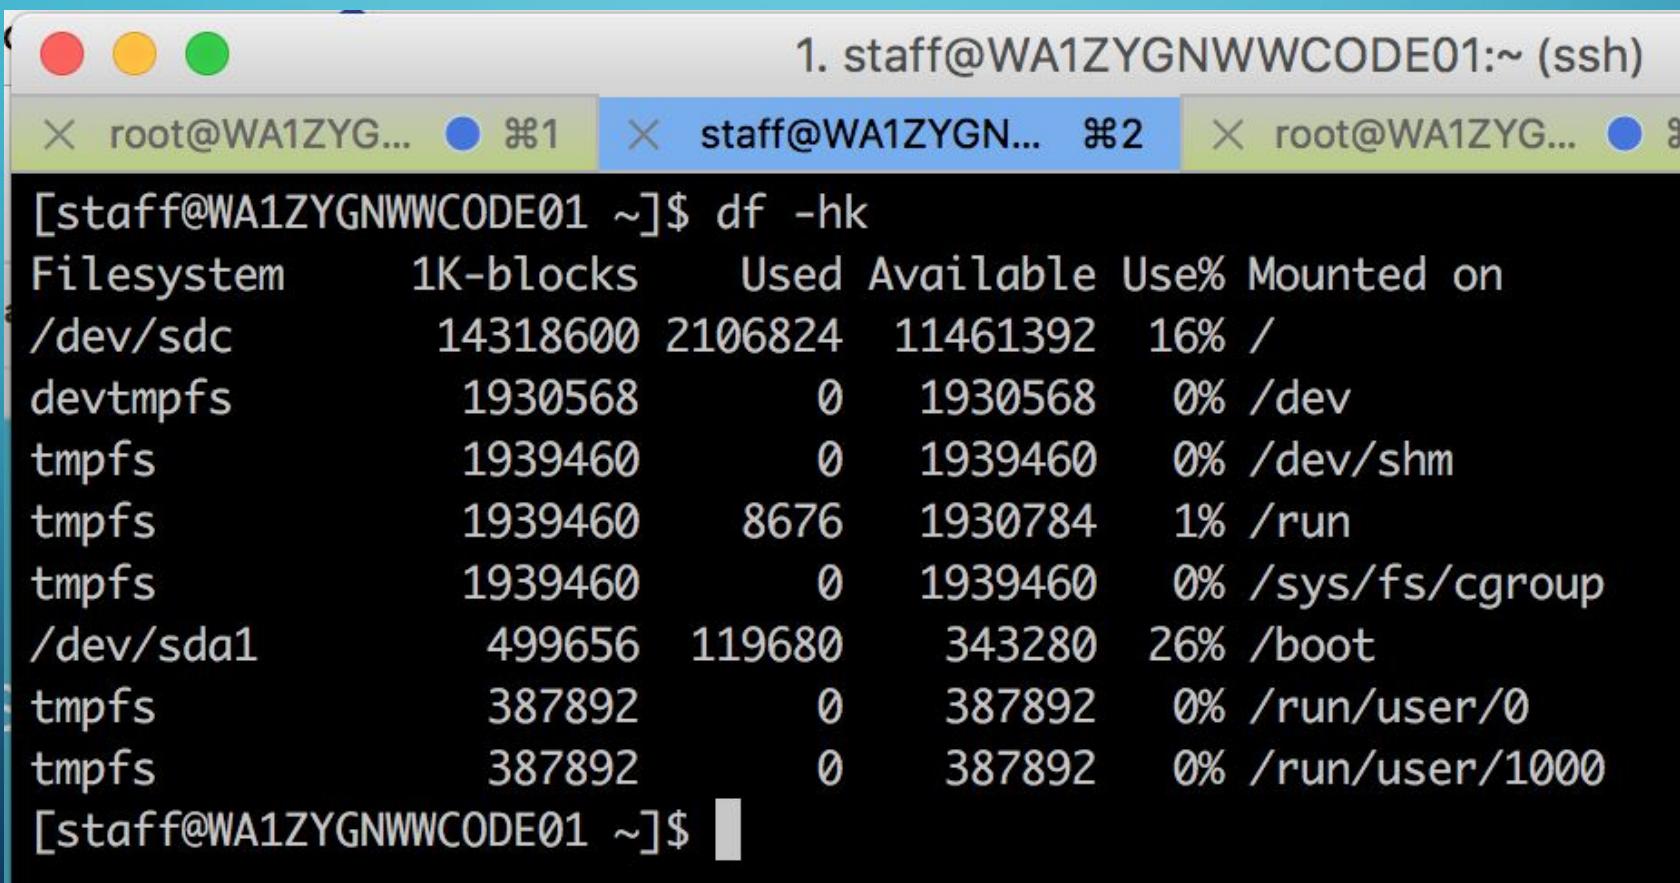

```
$ vmstat -s
```

```
[staff@WA1ZYGNNWWCODE01 ~]$ vmstat -s
3878920 K total memory
128336 K used memory
942500 K active memory
993232 K inactive memory
1688736 K free memory
95796 K buffer memory
1966052 K swap cache
2097148 K total swap
0 K used swap
2097148 K free swap
```

Disk: df (display free disk space)

```
$ df -hk
```

The screenshot shows a terminal window with three tabs at the top. The active tab is labeled 'staff@WA1ZYG... ~' (ssh). The terminal displays the output of the 'df -hk' command, which provides a detailed view of disk usage across various file systems.

| Filesystem | 1K-blocks | Used | Available | Use% | Mounted on |
|------------|-----------|---------|-----------|------|----------------|

```

KILL! How to give a process the ax

\$ kill <PID>

signal or terminate process by ID

\$ kill -9 <PID>

terminates process and all dependent processes with extreme prejudice

\$ killall <ProcessName>

kills all processes with process name

LIVE DEMO

Compressing files: tar or gzip

```
$ tar -czvf <tarfile.tar.gz> <file-to-be-compressed>
```

Create, Zip, Verbose, Filename

```
$ tar -xvf <tarfile.tar.gz>
```

EXtract, Verbose, Filename

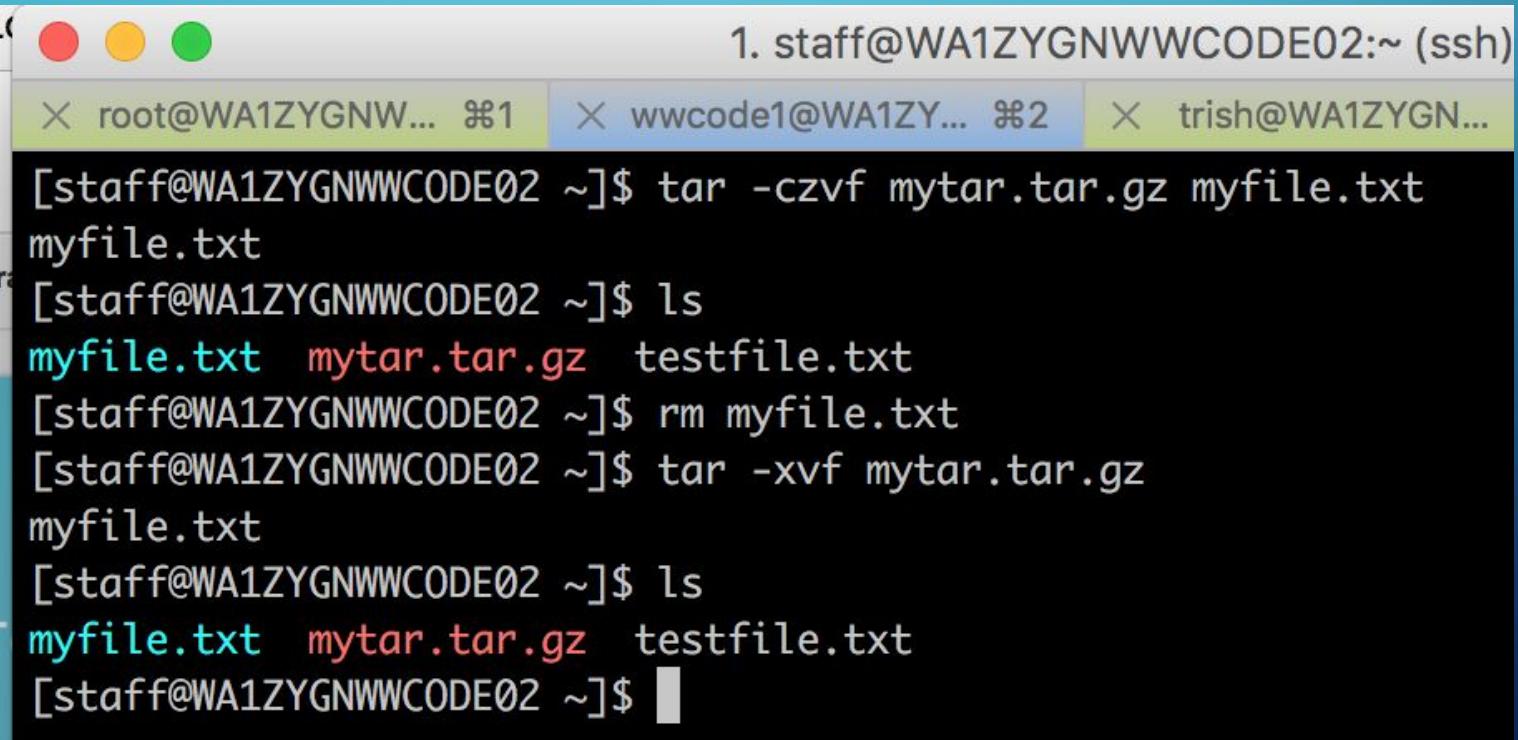

HANDS ON: Create a tar

```
$ tar -czvf mytar.tar.gz myfile.txt
```

```
$ ls; rm myfile.txt;ls
```

```
$ tar -xvf mytar.tar.gz
```

```
$ ls -la
```

The screenshot shows a terminal window with three tabs at the top: 'root@WA1ZYG...', 'wwcode1@WA1ZY...', and 'trish@WA1ZYG...'. The current tab is 'trish@WA1ZYG...'. The terminal history is as follows:

```
[staff@WA1ZYGNNWCODE02 ~]$ tar -czvf mytar.tar.gz myfile.txt
myfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ ls
myfile.txt  mytar.tar.gz  testfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ rm myfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ tar -xvf mytar.tar.gz
myfile.txt
[staff@WA1ZYGNNWCODE02 ~]$ ls
myfile.txt  mytar.tar.gz  testfile.txt
[staff@WA1ZYGNNWCODE02 ~]$
```

Remote Shell Login - SSH

Login into a remote box - for example a server hosting your application. Secured with key

```
$ ssh <username>@<hostname>
```

type 'exit' to leave the session

Secure Copy - SCP

Securely copies a file from local to remote and vice versa.

Local to remote:

```
$ scp <local_file_path> <username>@<hostname>:<path>
```

Remote to local:

```
$ scp <username>@host:path <local_file_path>
```

HANDS ON: SSH & SCP

```
$ scp mytar.tar.gz staff@10.82.36.12:/home/staff/  
$ ssh staff@10.82.36.12
```

The screenshot shows a terminal window with the title "1. staff@WA1ZYGNNWWCODE01:~ (ssh)". The window has four tabs at the top: "root@WA1ZYGNN... #1", "wwcode1@WA1ZY... #2", "trish@WA1ZYG... #3", and "staff@WA1ZYG... #4". The fourth tab is active.

```
[staff@WA1ZYGNNWWCODE02 ~]$ scp mytar.tar.gz staff@10.82.36.12:/home/staff/  
The authenticity of host '10.82.36.12 (10.82.36.12)' can't be established.  
ECDSA key fingerprint is 35:76:f2:83:ad:cb:16:6b:59:e4:5c:87:5e:6e:01:6b.  
Are you sure you want to continue connecting (yes/no)? yes  
Warning: Permanently added '10.82.36.12' (ECDSA) to the list of known hosts.  
staff@10.82.36.12's password:  
mytar.tar.gz  
[staff@WA1ZYGNNWWCODE02 ~]$ ssh staff@10.82.36.12  
staff@10.82.36.12's password:  
Last login: Sun Apr 30 19:52:10 2017 from 174.127.218.148  
[staff@WA1ZYGNNWWCODE01 ~]$ ls  
1st.txt mytar.tar.gz wwcode  
[staff@WA1ZYGNNWWCODE01 ~]$
```

RBAC

Role-based access control (RBAC) is a method of regulating access to computer or network resources based on the roles of individual users within an enterprise. In this context, access is the ability of an individual user to perform a specific task, such as view, create, or modify a file.

SUDO: With Great Power Comes Great Responsibility

```
$ sudo <command>
```

executes command as a sudo user
“superuser do” (e.g. root, admin)

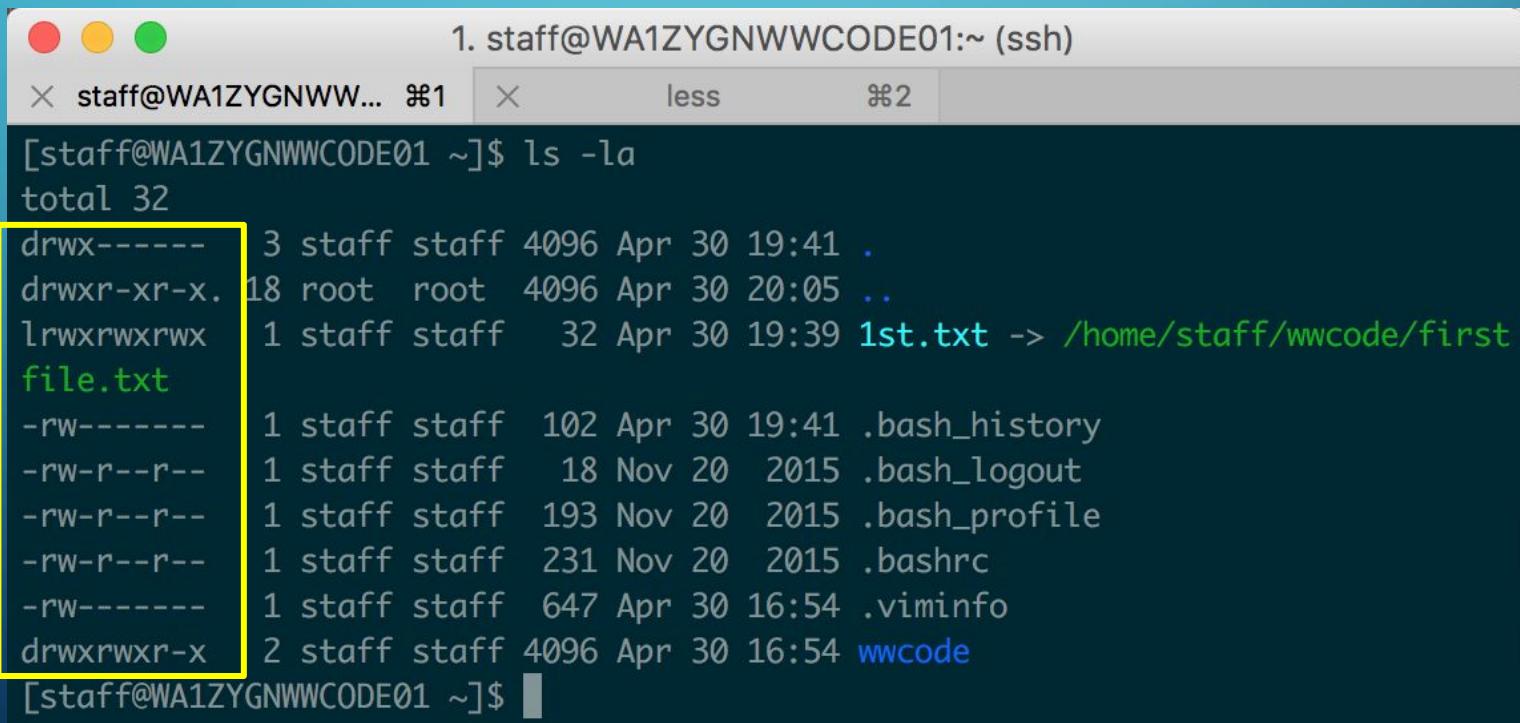

CHMOD

change file access control:

3 Groups: Owner, Group, Others

3 Types: Read, Write, Executable

\$ chmod 777 <filename/foldername>

The screenshot shows a terminal window titled "staff@WA1ZYGNNWCODE01:~ (ssh)". The command "ls -la" is run, displaying a list of files and their permissions. A yellow box highlights the first file, "file.txt", which has permissions "drwxr-xr-x".

```
[staff@WA1ZYGNNWCODE01 ~]$ ls -la
total 32
drwxr-xr-x  3 staff  staff  4096 Apr 30 19:41 .
drwxr-xr-x 18 root   root   4096 Apr 30 20:05 ..
lrwxrwxrwx  1 staff  staff   32 Apr 30 19:39 1st.txt  -> /home/staff/wwcode/first
-rw-r--r--  1 staff  staff    102 Apr 30 19:41 .bash_history
-rw-r--r--  1 staff  staff     18 Nov 20 2015 .bash_logout
-rw-r--r--  1 staff  staff    193 Nov 20 2015 .bash_profile
-rw-r--r--  1 staff  staff    231 Nov 20 2015 .bashrc
-rw-r--r--  1 staff  staff   647 Apr 30 16:54 .viminfo
drwxrwxr-x  2 staff  staff  4096 Apr 30 16:54 wwcode
[staff@WA1ZYGNNWCODE01 ~]$
```

CHOWN

change file owner and group

```
$ chown <user>:<group> <filename>
```

```
$ chown -R <user>:<group> <foldername>
```

-R for recursive, only for folders
